Pattern matching

Substring search. Find a single string in text.

Pattern matching. Find one of a specified set of strings in text.

Ex. [genomics]

- Fragile X syndrome is a common cause of mental retardation.
- A human's genome is a string.
- It contains triplet repeats of CGG or AGG, bracketed by GCG at the beginning and CTG at the end.
- Number of repeats is variable and is correlated to syndrome.

pattern GCG(CGG|AGG)*CTG

text GCGGCGTGTGCGAGAGAGTGGGTTTAAAGCTGGCGCGGAGGCGGCTGGCGCGGAGGCTG

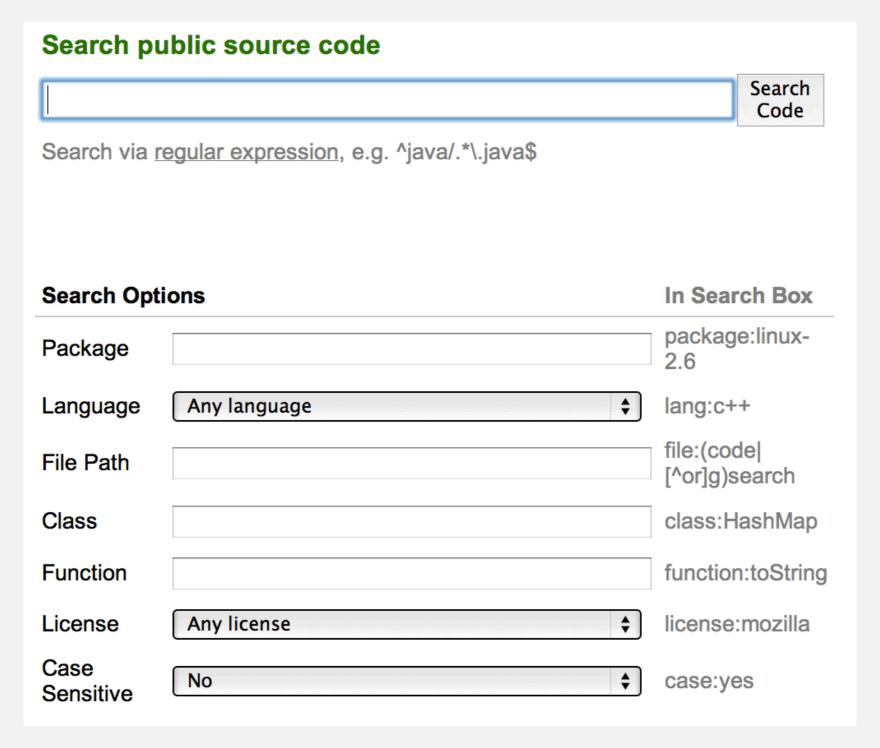

Syntax highlighting

Google code search

http://code.google.com/p/chromium/source/search

Pattern matching: applications

Test if a string matches some pattern.

- Scan for virus signatures.
- Process natural language.
- Specify a programming language.
- Access information in digital libraries.
- Search genome using PROSITE patterns.
- Filter text (spam, NetNanny, Carnivore, malware).
- Validate data-entry fields (dates, email, URL, credit card).

. . .

Form Validation

First name:

Parse text files.

- Compile a Java program.
- · Crawl and index the Web.
- Read in data stored in ad hoc input file format.
- Create Java documentation from Javadoc comments.

. . .

Regular expressions

A regular expression is a notation to specify a set of strings.

operation	order	example RE	matches	does not match
concatenation	3	AABAAB	AABAAB	every other string
or	4	AA BAAB	AA BAAB	every other string
closure	2	AB*A	AA ABBBBBBBBA	AB ABABA
parentheses 1	1	A(A B)AAB	AAAAB ABAAB	every other string
	I	(AB)*A	A ABABABABA	AA ABBA

Regular expression: quiz 1

Which one of the following strings is not matched by the regular expression ($AB \mid C*D$) * ?

- A. ABABAB
- B. CDCCDDDD
- C. ABCCDAB
- D. ABDABCABD
- **E.** *I don't know.*

Regular expression shortcuts

Additional operations are often added for convenience.

operation	example RE	matches	does not match
wildcard	.U.U.U.	CUMULUS JUGULUM	SUCCUBUS TUMULTUOUS
character class	[A-Za-z][a-z]*	word Capitalized	camelCase 4illegal
at least 1	A(BC)+DE	ABCDE ABCBCDE	ADE BCDE
exactly k	[0-9]{5}-[0-9]{4}	08540-1321 19072-5541	11111111 166-54-111

Ex. [A-E]+ is shorthand for (A|B|C|D|E) (A|B|C|D|E)*

Regular expression examples

RE notation is surprisingly expressive.

regular expression	matches	does not match
.*SPB.* (substring search)	RASPBERRY CRISPBREAD	SUBSPACE SUBSPECIES
[0-9]{3}-[0-9]{2}-[0-9]{4} (U. S. Social Security numbers)	166-11-4433 166-45-1111	11-5555555 8675309
[a-z]+@([a-z]+\.)+(edu com) (simplified email addresses)	wayne@princeton.edu rs@princeton.edu	spam@nowhere
[\$_A-Za-z] [\$_A-Za-z0-9]* (Java identifiers)	ident3 PatternMatcher	3a ident#3

REs play a well-understood role in the theory of computation.

Regular expression golf

http://xkcd.com/1313

yes	no
obama	romney
bush	mccain
clinton	kerry
reagan	gore
	•••
washington	clinton

- Ex. Match elected presidents but not opponents (unless they later won).
- RE. bu|[rn]t|[coy]e|[mtg]a|j|iso|n[h1]|[ae]d|lev|sh|[lnd]i|[po]o|ls

Illegally screening a job candidate

```
" [First name]! and pre/2 [last name] w/7
bush or gore or republican! or democrat! or charg!
or accus! or criticiz! or blam! or defend! or iran contra
or clinton or spotted owl or florida recount or sex!
or controvers! or fraud! or investigat! or bankrupt!
or layoff! or downsiz! or PNTR or NAFTA or outsourc!
or indict! or enron or kerry or iraq or wmd! or arrest!
or intox! or fired or racis! or intox! or slur!
or controvers! or abortion! or gay! or homosexual!
or gun! or firearm! "
```

— LexisNexis search pattern used by Monica Goodling

to screen candidates for DOJ positions

Regular expression caveat

Writing a RE is like writing a program.

- Need to understand programming model.
- Can be easier to write than read.
- Can be difficult to debug.

"Some people, when confronted with a problem, think 'I know I'll use regular expressions.' Now they have two problems."

Jamie Zawinski (flame war on alt.religion.emacs)

Bottom line. REs are amazingly powerful and expressive, but using them in applications can be amazingly complex and error-prone.

5.4 REGULAR EXPRESSIONS

- regular expressions
- REs and NFAs
 - NFA simulation
- NFA construction
 - applications

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

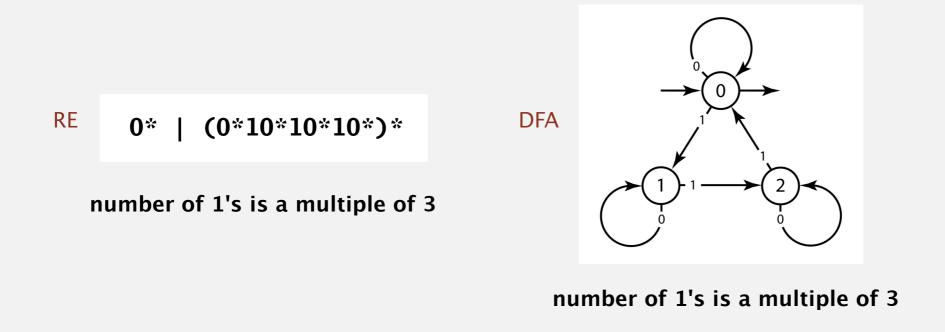

Duality between REs and DFAs

RE. Concise way to describe a set of strings.

DFA. Machine to recognize whether a given string is in a given set.

Kleene's theorem.

- For any DFA, there exists a RE that describes the same set of strings.
- For any RE, there exists a DFA that recognizes the same set of strings.

Stephen Kleene Princeton Ph.D. 1934

Pattern matching implementation: basic plan (first attempt)

Overview is the same as for KMP.

- No backup in text input stream.
- Linear-time guarantee.

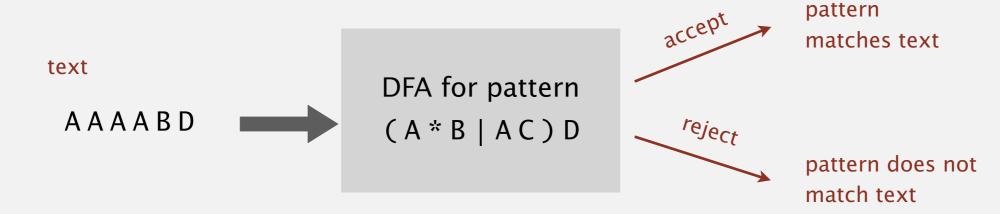

Ken Thompson Turing Award '83

Underlying abstraction. Deterministic finite state automata (DFA).

Basic plan. [apply Kleene's theorem]

- Build DFA from RE.
- Simulate DFA with text as input.

Bad news. Basic plan is infeasible (DFA may have exponential # of states).

Pattern matching implementation: basic plan (revised)

Overview is similar to KMP.

- No backup in text input stream.
- Quadratic-time guarantee (linear-time typical).

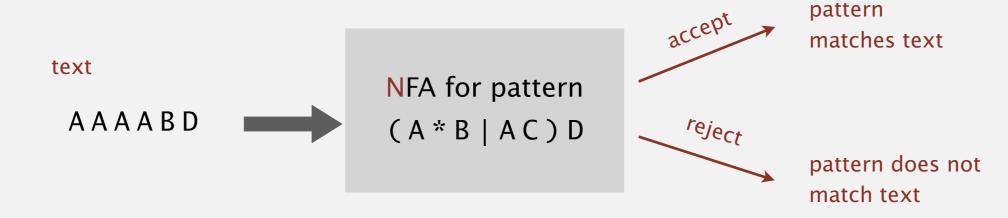

Ken Thompson Turing Award '83

Underlying abstraction. Nondeterministic finite state automata (NFA).

Basic plan. [apply Kleene's theorem]

- Build NFA from RE.
- Simulate NFA with text as input.

Q. What is an NFA?

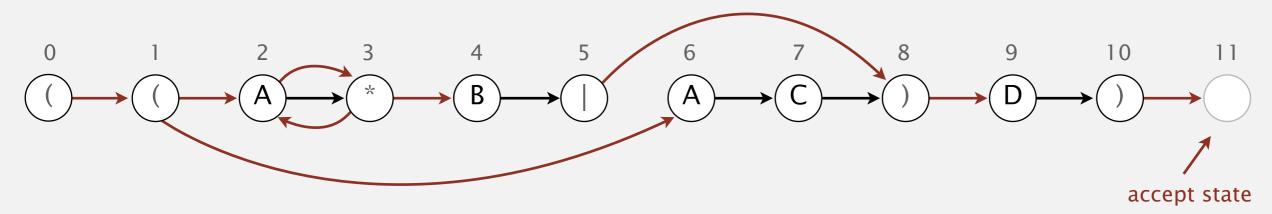

Regular-expression-matching NFA.

- We assume RE enclosed in parentheses.
- One state per RE character (start = 0, accept = M).
- Red ε-transition (change state, but don't scan text).
- Black match transition (change state and scan to next text char).
- Accept if any sequence of transitions ends in accept state.

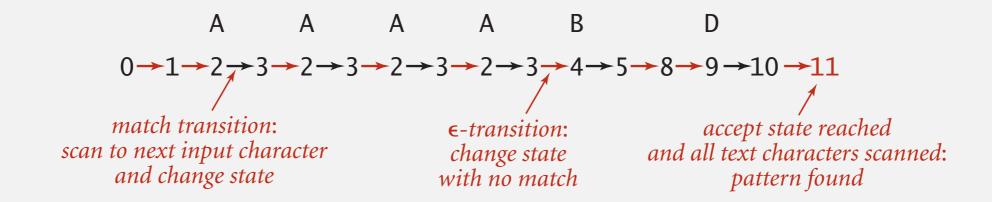

after scanning all text characters

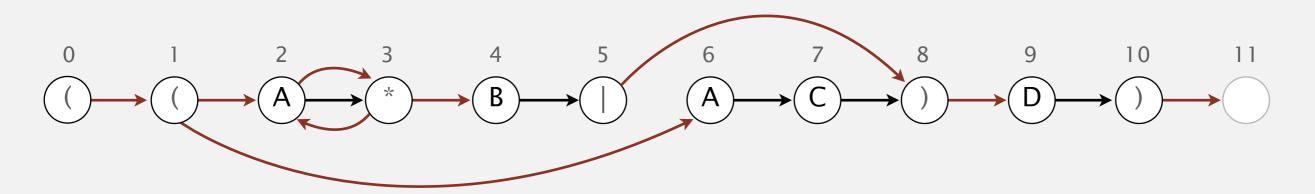

Nondeterminism.

- One view: machine can guess the proper sequence of state transitions.
- Another view: sequence is a proof that the machine accepts the text.

- Q. Is A A A A B D matched by NFA?
- A. Yes, because some sequence of legal transitions ends in state 11.

- Q. Is A A A A B D matched by NFA?
- A. Yes, because some sequence of legal transitions ends in state 11.

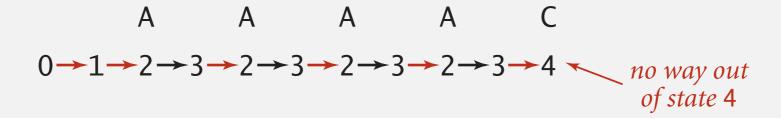

[even though some sequences end in wrong state or get stuck]

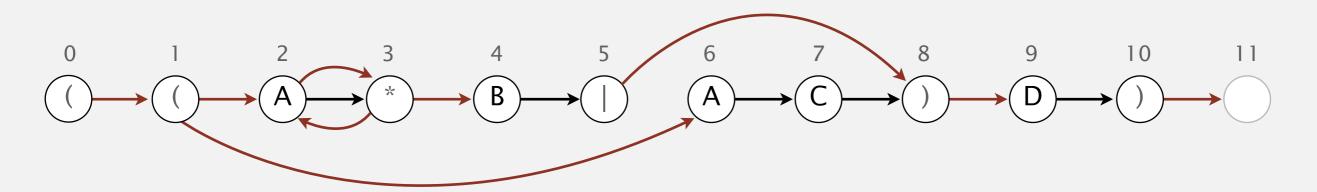

- Q. Is A A A C matched by NFA?
- A. No, because no sequence of legal transitions ends in state 11.

[but need to argue about all possible sequences]

Nondeterminism

Q. How to determine whether a string is matched by an automaton?

DFA. Deterministic \Rightarrow easy (only one applicable transition at each step).

NFA. Nondeterministic \Rightarrow hard (can be several applicable transitions at each step; need to select the "right" ones!)

- Q. How to simulate NFA?
- A. Systematically consider all possible transition sequences. [stay tuned]

5.4 REGULAR EXPRESSIONS

regular expressions

REs and NFAs

NFA simulation

NFA construction

applications

Algorithms

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

NFA representation

State names. Integers from 0 to *M*.

number of symbols in RE

Match-transitions. Keep regular expression in array re[].

 ε -transitions. Store in a digraph G.

$$0 \rightarrow 1, 1 \rightarrow 2, 1 \rightarrow 6, 2 \rightarrow 3, 3 \rightarrow 2, 3 \rightarrow 4, 5 \rightarrow 8, 8 \rightarrow 9, 10 \rightarrow 11$$

NFA simulation

- Q. How to efficiently simulate an NFA?
- A. Maintain set of all possible states that NFA could be in after reading in the first i text characters.

one step in simulating an NFA

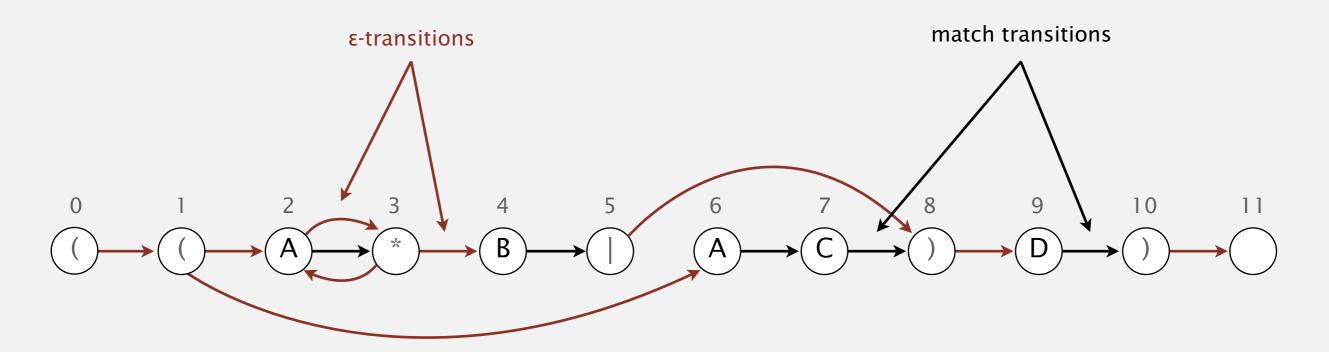

Q. How to perform reachability?

NFA simulation demo

Goal. Check whether input matches pattern.

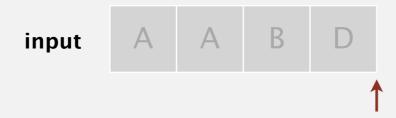

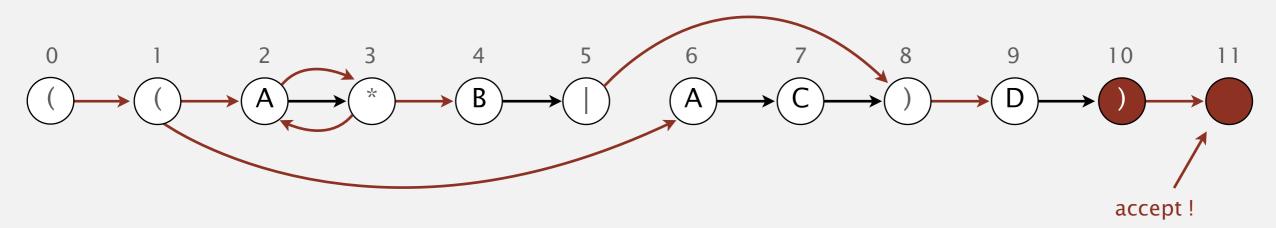

NFA simulation demo

When no more input characters:

- Accept if any state reachable is an accept state.
- Reject otherwise.

set of states reachable: { 10, 11 }

Digraph reachability

Digraph reachability. Find all vertices reachable from a given vertex or set of vertices.

recall Section 4.2

Solution. Run DFS from each source, without unmarking vertices. Performance. Runs in time proportional to E + V.

NFA simulation: Java implementation

```
public class NFA
  private char[] re;  // match transitions
  private Digraph G; // epsilon transition digraph
  private int M; // number of states
  public NFA(String regexp)
     M = regexp.length();
     re = regexp.toCharArray();
     G = buildEpsilonTransitionDigraph();
                                                              stay tuned
   public boolean recognizes(String txt)
   { /* see next slide */ }
   public Digraph buildEpsilonTransitionDigraph()
   { /* stay tuned */ }
```

NFA simulation: Java implementation

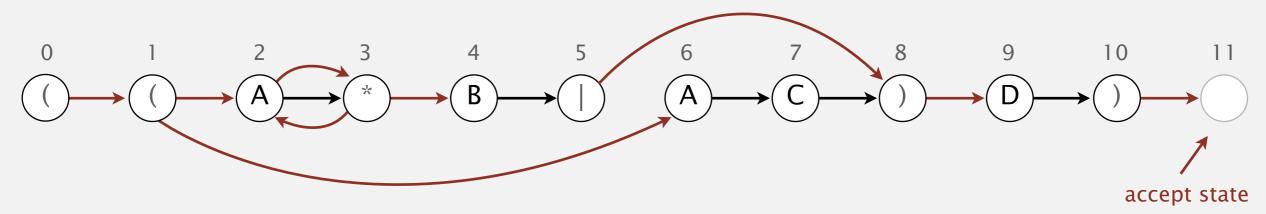

```
public boolean recognizes(String txt)
   Bag<Integer> pc = new Bag<Integer>();
                                                                      states reachable from
   DirectedDFS dfs = new DirectedDFS(G, 0);
                                                                      start by ε-transitions
   for (int v = 0; v < G.V(); v++)
      if (dfs.marked(v)) pc.add(v);
   for (int i = 0; i < txt.length(); i++)
                                                                      set of states reachable after
      Bag<Integer> states = new Bag<Integer>();
                                                                      scanning past txt.charAt(i)
      for (int v : pc)
                                                                      not necessarily a match
          if (v == M) continue;
                                                                      (RE needs to match full text)
          if ((re[v] == txt.charAt(i)) \mid\mid re[v] == '.')
             states.add(v+1);
      dfs = new DirectedDFS(G, states);
      pc = new Bag<Integer>();
                                                                      follow ε-transitions
      for (int v = 0; v < G.V(); v++)
          if (dfs.marked(v)) pc.add(v);
   }
   for (int v : pc)
      if (v == M) return true;
                                                                      accept if can end in state M
   return false;
```

NFA simulation: analysis

Proposition. Determining whether an N-character text is recognized by the NFA corresponding to an M-character pattern takes time proportional to MN in the worst case.

Pf. For each of the N text characters, we iterate through a set of states of size no more than M and run DFS on the graph of ε -transitions.

[The NFA construction we will consider ensures the number of edges $\leq 3M$.]

ROBERT SEDGEWICK | KEVIN WAYNE

http://algs4.cs.princeton.edu

Building an NFA corresponding to an RE

States. Include a state for each symbol in the RE, plus an accept state.

Building an NFA corresponding to an RE

Concatenation. Add match-transition edge from state corresponding to characters in the alphabet to next state.

Alphabet. A B C D
Metacharacters. () . * |

Building an NFA corresponding to an RE

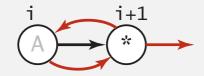

Parentheses. Add ε -transition edge from parentheses to next state.

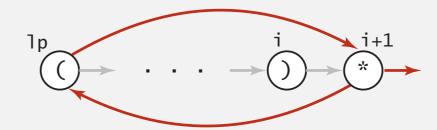

Building an NFA corresponding to an RE

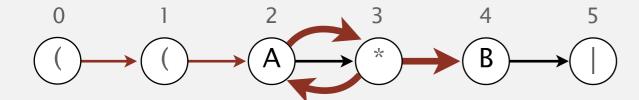

Closure. Add three ε -transition edges for each * operator.

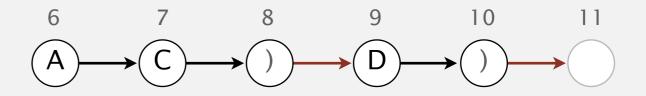

single-character closure

closure expression

Building an NFA corresponding to an RE

2-way or. Add two ε -transition edges for each | operator.

REGULAR EXPRESSIONS

Q. How to implement the + and multiway or operators?

NFA corresponding to the pattern (($AB \mid C \mid D$) +)

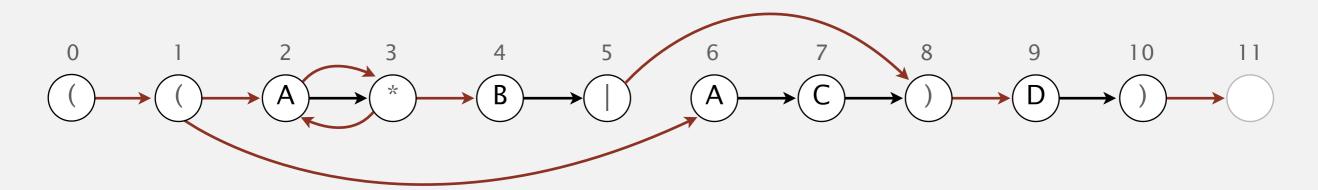

NFA construction: implementation

Goal. Write a program to build the ε -transition digraph.

Challenges. Remember left parentheses to implement closure and or; remember | symbols to implement or.

Solution. Maintain a stack.

- (symbol: push (onto stack.
- | symbol: push | onto stack.
-) symbol: pop corresponding (and any intervening |; add ϵ -transition edges for closure/or.

NFA construction demo

stack

NFA construction demo

NFA corresponding to the pattern (($A * B \mid A C) D$)

NFA construction: Java implementation

```
private Digraph buildEpsilonTransitionDigraph() {
   Digraph G = \text{new Digraph}(M+1);
   Stack<Integer> ops = new Stack<Integer>();
   for (int i = 0; i < M; i++) {
      int lp = i;
      if (re[i] == '(' || re[i] == '|') ops.push(i);
                                                                   left parentheses and |
      else if (re[i] == ')') {
         int or = ops.pop();
         if (re[or] == '|') {
                                                                   2-way or
            lp = ops.pop();
            G.addEdge(lp, or+1);
            G.addEdge(or, i);
         else lp = or;
                                                                   closure
      if (i < M-1 \&\& re[i+1] == '*') {
                                                                   (needs 1-character lookahead)
         G.addEdge(lp, i+1);
         G.addEdge(i+1, lp);
      if (re[i] == '(' || re[i] == '*' || re[i] == ')')
                                                                  metasymbols
         G.addEdge(i, i+1);
   return G;
}
```

NFA construction: analysis

Proposition. Building the NFA corresponding to an M-character RE takes time and space proportional to M.

Pf. For each of the M characters in the RE, we add at most three ϵ -transitions and execute at most two stack operations.

5.4 REGULAR EXPRESSIONS

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications

Robert Sedgewick | Kevin Wayne

Industrial-strength grep implementation

To complete the implementation:

- Add multiway or.
- Handle metacharacters.
- Support character classes.
- Add capturing capabilities.
- Extend the closure operator.
- Error checking and recovery.
- Greedy vs. reluctant matching.

Ex. Which substring(s) should be matched by the RE <bli>k>.*</blink>?

Regular expressions in the wild

Broadly applicable programmer's tool.

- Originated in Unix in the 1970s.
- Built in to many tools: grep, egrep, emacs,

• Built in to many languages: awk, Perl, PHP, Python, JavaScript,

Regular expressions in Java

Validity checking. Does the input match the re?

Java string library. Use input.matches(re) for basic RE matching.

```
public class Validate
{
   public static void main(String[] args)
   {
     String regexp = args[0];
     String input = args[1];
     StdOut.println(input.matches(re));
   }
}
```

```
% java Validate "[$_A-Za-z][$_A-Za-z0-9]*" ident123
true

% java Validate "[a-z]+@([a-z]+\.)+(edu|com)" rs@cs.princeton.edu
true

% java Validate "[0-9]{3}-[0-9]{2}-[0-9]{4}" 166-11-4433

Social Security number
true
```

Harvesting information

Goal. Print all substrings of input that match a RE.

```
% java Harvester "gcg(cgg|agg)*ctg" chromosomeX.txt
gcgcggcggcggctg
gcgctg
gcgctg
                               harvest patterns from DNA
gcgcggcggaggcggaggcggctg
                               harvest links from website
% java Harvester "http://(\w+\.)*(\w+)" http://www.cs.princeton.edu

http://www.cs.princeton.edu
http://www.princeton.edu
```

Harvesting information

RE pattern matching is implemented in Java's java.util.regexp.Pattern and java.util.regexp.Matcher classes.

```
import java.util.regex.Pattern;
import java.util.regex.Matcher;
                                                                     compile() creates a
public class Harvester
                                                                     Pattern (NFA) from RE
{
   public static void main(String[] args)
                                                                     matcher() creates a
      String regexp = args[0];
                                                                     Matcher (NFA simulator)
                        = new In(args[1]);
      In in
                                                                     from NFA and text
      String input = in.readAll();
      Pattern pattern = Pattern.compile(regexp);
      Matcher matcher = pattern.matcher(input);
                                                                     find() looks for
      while (matcher.find())
                                                                     the next match
          StdOut.println(matcher.group());
                                                                     group() returns
                                                                     the substring most
                                                                     recently found by find()
```

Algorithmic complexity attacks

Warning. Typical implementations do not guarantee performance!

SpamAssassin regular expression.

```
% java RE "[a-z]+@[a-z]+([a-z\.]+\.)+[a-z]+" spammer@x......
```

- Takes exponential time on pathological email addresses.
- Attacker can use such addresses to DOS a mail server.

Not-so-regular expressions

Back-references.

- \1 notation matches subexpression that was matched earlier.
- Supported by typical RE implementations.

Some non-regular languages.

- Strings of the form ww for some string w: beriberi.
- Unary strings with a composite number of 1s: 111111.
- Bitstrings with an equal number of 0s and 1s: 01110100.
- Watson-Crick complemented palindromes: atttcggaaat.

Remark. Pattern matching with back-references is intractable.

Context

Abstract machines, languages, and nondeterminism.

- Basis of the theory of computation.
- Intensively studied since the 1930s.
- Basis of programming languages.

Compiler. A program that translates a program to machine code.

- KMP string \Rightarrow DFA.
- grep $RE \Rightarrow NFA$.
- javac Java language ⇒ Java byte code.

	KMP	grep	Java
pattern	string	RE	program
parser	unnecessary	check if legal	check if legal
compiler output	DFA	NFA	byte code
simulator	DFA simulator	NFA simulator	JVM

Summary of pattern-matching algorithms

Programmer.

- Implement substring search via DFA simulation.
- Implement RE pattern matching via NFA simulation.

Theoretician.

- RE is a compact description of a set of strings.
- NFA is an abstract machine equivalent in power to RE.
- DFAs, NFAs, and REs have limitations.

You. Practical application of core computer science principles.

Example of essential paradigm in computer science.

- Build intermediate abstractions.
- Pick the right ones!
- Solve important practical problems.
